### AMENDMENT TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in this application:

#### Listing of Claims:

1. (Original) A system for preventing automated crawler access to data from a network-based data source, comprising:

a transcoding proxy for automatically permutating data retrieved from the data source, to render the data uninterpretable by the crawler, while allowing a browser to render data retrieved from the data source.

2. (Original) A system for preventing automated crawler access to data from a network-based data source, comprising:

a transcoding proxy for automatically preventing crawler access to the data source, while allowing browser access to the data source.

3. (Currently amended) [[The system according to claim 1, wherein the transcoding proxy further]] A system for preventing automated crawler access to data from a network-based data source, comprising:

a transcoding proxy that automatically prevents crawler access to the data source[.]; and

wherein the transcoding proxy concurrently permits a browser to access [[while allowing browser access to]] the data source.

4. (Original) The system according to claim 1, wherein the transcoding proxy utilizes a transcoding technique that dynamically changes a form structure.

Application Serial No.: 09/617,460  
Amendment dated: 07/05/2004

Reply to Office action of: 04/05/2004  
Attorney Docket No.: ARC9-2000-0116 US1

5. (Original) The system according to claim 1, wherein the transcoding proxy utilizes a transcoding technique that dynamically changes a form content.

6. (Original) The system according to claim 2, wherein the data retrieved from the data source include a variable with a name; and  
wherein the transcoding proxy utilizes a transcoding technique that dynamically changes the name of the variable.

7. (Original) The system according to claim 1, wherein the data retrieved from the data source include a textual content; and  
wherein the transcoding proxy utilizes a transcoding technique that dynamically changes the textual content into non-textual content.

8. (Original) The system according to claim 1, wherein the data retrieved from the data source includes a form containing a variable with a value;  
wherein the transcoding proxy utilizes a transcoding technique that incorporates an executable application in the form; and  
wherein when the executable application is implemented, it dynamically alter the value of the variable.

9. (Original) The system according to claim 1, wherein the data retrieved from the data source is collected in a page;  
wherein the transcoding proxy utilizes a transcoding technique that incorporates an executable application in the page; and  
wherein when the executable application is implemented, it dynamically generates the page and renders the data.

Application Serial No.: 09/617,460  
Amendment dated: 07/05/2004

Reply to Office action of: 04/05/2004  
Attorney Docket No.: ARC9-2000-0116 US1

10. (Original) A system for preventing automated crawler access to data from a network-based data source, comprising:

a transcoding proxy for selectively, automatically permutating data retrieved from the data source, to render the data uninterpretable by one or more crawlers, while allowing a browser to render data retrieved from the data source; and

wherein the transcoding proxy further selectively, automatically prevents one or more crawlers from accessing the data source, while allowing browser access to the data source.

11. (Original) The system according to claim 10, wherein the data retrieved from the data source contain any one or more of: a variable with a name, a textual content, or a value;

wherein the data retrieved from the data source are collected in one or more of: a form or a page; and

wherein the transcoding proxy uses one or more of the following transcoding techniques:

a first transcoding technique that dynamically changes a form structure;

a second transcoding technique that dynamically changes a form content;

a third transcoding technique that dynamically changes the name of the variable;

a fourth transcoding technique that dynamically changes the textual content into a non-textual content;

a fifth transcoding technique that incorporates an executable application in the form, and wherein when the executable application is implemented, it dynamically alter the value of the for variable; and/or

Application Serial No.: 09/617,460  
Amendment dated: 07/05/2004

Attorney Docket No.: ARC9-2000-0116 US1

a sixth transcoding technique that incorporates an executable application in the page, and wherein when the executable application is implemented, it dynamically generates the page and renders the data.

12. (Original) The system according to claim 4, wherein the transcoding technique changes the form structure by shifting the position of the data in the form.

13. (Original) The system according to claim 12, wherein the transcoding technique shifts the position of form data by inserting any one or more of: a character, a string of characters, a space, non-textual data, a blank row, a blank column, and/or an empty table.

14. (Currently amended) [[The system according to claim 13,]] A system for preventing automated crawler access to data from a network-based data source, comprising:

a transcoding proxy for automatically permutating data retrieved from the data source, to render the data uninterpretable by the crawler, while allowing a browser to render data retrieved from the data source;

wherein the transcoding proxy utilizes a transcoding technique that dynamically changes a form structure;

wherein the transcoding technique changes the form structure by shifting the position of the data in the form;

wherein the transcoding technique shifts the position of form data by inserting any one or more of: a character, a string of characters, a space, non-textual data, a blank row, a blank column, and/or an empty table; and

wherein the transcoding technique shifts the position of form data by nesting the data in a table within a table.

Application Serial No.: 09/617,460  
Amendment dated: 07/05/2004

Attorney Docket No.: ARC9-2000-0116 US1

15. (Currently amended) [[The system according to claim 5,]] A system for preventing automated crawler access to data from a network-based data source, comprising:

a transcoding proxy for automatically permutating data retrieved from the data source, to render the data uninterpretable by the crawler, while allowing a browser to render data retrieved from the data source;

wherein the transcoding proxy utilizes a transcoding technique that dynamically changes a form content; and

wherein the transcoding technique changes the form content by adding one or more content inserts that are substantially imperceptible to a browser user, in order to render selected terms in the page content difficult to be searched automatically by the crawler.

16. (Original) The system according to claim 15, wherein the content inserts include any one or more of: a characters, a string of characters, non-textual data, and/or a string of images.

17. (Currently amended) The system according to claim 16, wherein the transcoding technique calculates a synthetic name from [[the]] a variable name, and replaces the variable name with the synthetic name, in order to render selected terms difficult to be searched automatically by the crawler.

18. (Original) The system according to claim 17, wherein the variable is contained in a data entry form;

wherein the data entry form further includes a session ID; and

wherein the transcoding technique recalculates the variable name from the synthetic name to enable the data to be rendered by the browser.

Application Serial No.: 09/617,460  
Amendment dated: 07/05/2004

Reply to Office action of: 04/05/2004  
Attorney Docket No.: ARC9-2000-0116 US1

19. (Original) The system according to claim 7, wherein the transcoding technique replaces the textual content by a corresponding image, in order to render selected terms difficult to be searched automatically by the crawler.

20. (Original) The system according to claim 8, wherein the variable includes a label associated with the variable;

wherein the transcoding technique further transforms the label into a synthetic label; and

wherein the executable application recalculates the variable value in order to prevent a server from authenticating the crawler access to the data source.

21. (Original) The system according to claim 9, wherein the transcoding technique renders the data using an HTML code.

22. (Currently amended) A method for preventing automated crawler access to data from a network-based data source, comprising the steps of:

automatically permutating data retrieved from the data source, to render the data uninterpretable by the crawler[.]; and

concurrently [[while]] allowing a browser to render data retrieved from the data source.

Application Serial No.: 09/617,460  
Amendment dated: 07/05/2004

Reply to Office action of: 04/05/2004  
Attorney Docket No.: ARC9-2000-0116 US1

23. (Currently amended) [[The method according to claim 22,]] A method for preventing automated crawler access to data from a network-based data source, comprising the steps of:

automatically permutating data retrieved from the data source, to prevent a crawler from automatically accessing [further including automatically preventing crawler access to]] the data source[.]; and

concurrently permitting a browser from accessing [[while allowing browser access to]] the data source.

24. (Original) The method according to claim 23, wherein the data contain any one or more of: a variable with a name, a textual content, or a value; wherein the data are collected in one or more of: a form or a page; and wherein automatically permuting data and preventing crawler access include using one or more of the following transcoding techniques:

- a first transcoding technique that dynamically changes a form structure;
- a second transcoding technique that dynamically changes a form content;

- a third transcoding technique that dynamically changes the name of the variable;

- a fourth transcoding technique that dynamically changes the textual content into a non-textual content;

- a fifth transcoding technique that incorporates an executable application in the form, and wherein when the executable application is implemented, it dynamically alter the value of the for variable; and/or

- a sixth transcoding technique that incorporates an executable application in the page, and wherein when the executable application is implemented, it dynamically generates the page and renders the data.

Attorney Docket No.: ARC9-2000-0116 US1

25. (New) A system for preventing automated crawler access to data from a network-based data source, comprising:

a transcoding proxy for automatically permutating data retrieved from the data source, to render the data uninterpretable by the crawler, while allowing a browser to render data retrieved from the data source;

wherein the transcoding proxy utilizes a transcoding technique that dynamically changes a form structure;

wherein the transcoding technique changes the form structure by shifting the position of the data in the form; and

wherein the transcoding technique shifts the position of form data by nesting the data in a table within a table.
